

What is our GOAL for this MODULE?

The goal for this module is to learn about databases.

What did we ACHIEVE in the class TODAY?

Learned the importance of using a realtime database to create multiplayer games and to connect, read and write data into a remote realtime database.

Which CONCEPTS/CODING BLOCKS did we cover today?

- Firebase database
- Debugging

How did we DO the activities?

Designed a multiplayer game.

Sketched file code:

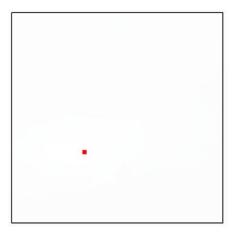

```
var ball;
     function setup(){
         createCanvas(500,500);
         ball = createSprite(250,250,10,10);
         ball.shapeColor = "red";
     function draw(){
         background("white"):
                                       white Hat Jr
         if(keyDown(LEFT_ARROW)){
            changePosition(-1,0);
         else if(keyDown(RIGHT_ARROW)){
             changePosition(1,0);
         else if(keyDown(UP_ARROW)){
            changePosition(0,-1);
20
21
22
23
24
25
26
27
28
         else if(keyDown(DOWN_ARROW)){
             changePosition(0,+1);
         drawSprites();
     function changePosition(x,y){
         ball.x = ball.x + x;
         ball.y = ball.y + y:
```

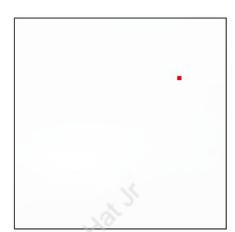

Css file code:

When you opened the application in two different browsers, the ball in the two browsers moved independently. Their movements were asynchronous.

Browser one Browser two

This happens because the ball's position in each browser is independent of the other's position. However, we could store the ball's position in a remote common database and our application reads the ball's position from the database and updates it when it changes.

Thus, we used Google Firebase's Real Time Database for this purpose.

Step 1: Go to https://console.firebase.google.com Login with your gmail id.

Step 2: Click on Create a New Project.

Step 3: Enter the name of your project. Accept terms and continue.

Step 4: Deny Google Analytics use.

Step 5: Visit the Database section of the dashboard and click on Create Database.

Step 6: Create the database in test mode for now.

Step 7: Add a child to create nodes which can hold ball's x and y positions.

Then, connect the firebase database to our application. Import a few firebase libraries which will allow us to read and write to our database.

Step 1: Click on the "Project Overview". Choose Add to web to get started.

Step 2: Get the firebase config key.

Step 3: Add this to the index.html file along with the src library for firebase database.

To get the reference to the position of the ball in the database:

- .ref() is used to refer to the location of the database value we care about.
- .on() creates a listener which keeps listening to the changes in the database.
- Every time a change in the database values of position (reference) occurred, the readPosition function was called.
- If there was any error in reading the values in the database, the showError function was called.

```
var hypnoticball, database;
var position;

function setup(){
    database = firebase.database():
    console.log(database);
    createCanvas(500,500);

hypnoticBall = createSprite(250.250.10.10);
hypnoticBall.shapeColor = "red";

var hypnoticBallPosition = database.ref('ball/position');
hypnoticBallPosition.on("value", readPosition, showError);
}

function draw(){
    background("white");
}
```

In the readPosition function we read the position of the value in the database. We assigned the x and y values of the ball position in the database to the ball sprite.

```
function readPosition(data){

position = data.val();

console log(position.x);

hypnoticBall.x = position.x;
hypnoticBall.y = position.y;

y
```

Thus, when you run the program, the ball in both the browsers moved in synchronized positions when the arrow keys were pressed. However, you noticed the bug where there was an error if the keys were pressed immediately on loading:

```
Hed Hal JY x Millied Ha
function draw(){
 background("white");
   if(keyDown(LEFT_ARROW)){
     writePosition(-1,0);
   else if(keyDown(RIGHT_ARROW)){
     writePosition(1,0);
   else if(keyDown(UP ARROW)){
     writePosition(0,-1);
   else if(keyDown(DOWN_ARROW)){
     writePosition(0,+1);
   drawSprites():
function writePosition(x.y){
 database.ref("ball/position").set({
    x: position.x + x ,
    y : position.y + y
```

You identified the bug and fixed it by updating the ball positions only when the position variable is defined.

And you debugged the program.

```
var hypnoticBallPosition = database.ref('ball/position');
 hypnoticBallPosition.on("value", readPosition, showError):
function draw(){
background("white");
 if(position !-- undefined)
   if(keyDown(LEFT_ARROW)){
     writePosition(-1.0);
                                     Militaria II x Militaria II
   else if(keyDown(RIGHT_ARROW)){
     writePosition(1,0);
   else if(keyDown(UP_ARROW)){
     writePosition(0,-1);
   else if(keyDown(DOWN_ARROW)){
     writePosition(0,+1);
   drawSprites():
function writePosition(x,y)[
 database.ref('ball/position').set({
    'x': position.x + x .
    'y': position.y + y
```

What's NEXT?

In the next class, you will be learning about structuring code prior to coding.

EXTEND YOUR KNOWLEDGE:

You can learn about the database through the following doc: https://firebase.google.com/docs
